from a subject. Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cyclin-dependent kinase 10, CDK10, proximal SNP probe.
                                                                                                                                                                                                                                                                                                                                                                                     Identifying a subject at risk of melanoma, useful for treating melanoma, comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a
                                                                                                                                                                                                                                  The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;

The method comprises determining the genotype of an affected individual with at least one polymorphic marker localised within the chromosomal region defined by and including marker D18S843 and D18S869 and determining the genotype associated with increased susceptibility to MD disorder. The method can be used for determining susceptibility to MD illness including bipolar disorder, genetic counselling of individuals from families affected with MD illness, and aid in the differential diagnosis of MD illness from other psychiatric pathologies. Products from the present invention can also be used to obtain modulators of IMP.189 myo- inositol monophosphatase protein activity and as targets for preventive and therapeutic treatments. The present sequence represents a PCR primer from the present sequence present sequence primer from the present sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 19 BP; 6 A; 4 C; 7 G; 2 T; 0 U; 0 Other;

(UYQU) UNIV QUEENSLAND

```
C(II) of up to 30 nucleobases in length or comprising eleven DNA residues C flanked on each side by four 2'-O-methyl RNA residues that inhibits the C expression of an inhibitor-of apoptosis (IAP) in the cell. Also C carrier; (2) a catalytic RNA molecule (III) comprising (I) and a C carrier; (2) a catalytic RNA molecule (III) comprising (I) and a C carrier; (2) a catalytic RNA molecule (IV) comprising an uncleic acid encoding one or more (III) positioned for expression in a mammalian C cell; (4) a double-stranded RNA molecule (IV) comsisting of 21-29 C nucleobases comprising at least eight consecutive nucleobases comprising at least eight consecutive nucleobases that comprise fully defined in the specification, comprising, e.g. 19 nucleobases that comprise at least eight consecutive nucleobases that comprise and a second domain complementary to the first domain, and a couple domain situated between the first and the second domains such that the first domain and the second domain are capable of duplexing to for phomogenic stranded hairpin RNA molecule; and (6) an expression vector (VI) comprising a nucleic acid molecule; and (6) an expression vector (VI) comprising a nucleic acid molecule; and (6) an expression vector (VI) comprising a nucleic acid molecule; and (6) an expression vector cuseful for treating an animal having a cancer or lymphoproliferative (I) is useful for enhancing the expression of an IAP in the double stranded RNA molecule; and (6) an expression year of a cell in an animal, preferably human the cute promyelocytic leukaemia, acute myelocytic leukaemia, acute myelocytic leukaemia, acute myelocytic leukaemia, acute explandamia conte compression of an IAP in the cell. (I) is also cute growelos between the context expression of an acute leukaemia, acute explosion of an acute symphocytic leukaemia, acute explandamia cell carcinoma, lung carci

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic acid. Screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR are difficult to amplify and identify. This sequence represents a PCR are difficult to amplify and identify.

New regulatory sequences from the fascin gene, useful for providing dendritic cell-specific expression of e.g. antigens, e.g. for vaccination against tumors and infections.
```

Claim 2b; Page 108; 117pp; German

cc allergic, neurological, immunomodulatory and apoptotic activity. (A) are cused to regulate expression of antigens, immunoregulators, antisense cc sequences etc. in DC-specific fashion. Recombinant DNA, vectors and host cells that contain (A) are useful: (1) in vaccines against viruses, antisense; and Alzheimer's disease; and (ii) for gene therapy of tumors, altergies, infections, autoimmune diseases and transplant rejection. They callergies, infections, autoimmune diseases and transplant rejection. They callergies, infections, autoimmune diseases and transplant rejection. They can also be provide specific expression of antigens and immunoregulators cl DC; for isolation and identification of cell factors and cis-elements from the degree of maturity of DC and to block transcription cetactors, by providing binding sites in DC. (A) provide DC-specific expression of nucleic acid under their control, allowing a more specific capuration of the immune response and eliminating the long and laborious purification of DC (since a complete leucocyte population may be transformed), including transformation in vitro. This sequence represents the invention This invention describes novel regulatory sequences (A) derived from human fascin that provide specific expression in dendritic cells (DC) which primer have antiviral, associated with the human fascin gene described in provide specific antibacterial, itibacterial, antifungal, antiparasitic, anti-immunomodulatory and apoptotic activity. (A) are the invention and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The invention relates to antisense oligonucleotides targeted to a nucleic CC acid molecule encoding human Survivin, where the antisense CC oligonucleotide inhibits the expression of human Survivin. These CC antisense oligonucleotides are used in the treatment of an animal CC suffering from a disease or condition associated with Survivin, e.g. a CC hyperproliferative condition such as cancer, and comprises administering CC atherapeutically or prophylactically effective amount of the antisense CC oligonucleotides con that expression of Survivin is inhibited. The CC disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonucleotide to the antisense oligonucleotide can be used to treat a human suffering from a CC disease or condition characterised by a reduction in apoptosis comprising CC antisense oligonucleotide to a human. In addition, the CC cantisense oligonucleotide to a human in addition, the CC cantisense oligonucleotide chemotherapeutic agent e.g. CC taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC curvivin mucleic acids, and antisense oligonucleotides targeted to CC Survivin nucleic acids, and antisense oligonucleotides targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated nucleic acids encoding polypeptides. CC designated NOVX polypeptides. The NOVX polypeptide and nucleic acid are useful for treating cardiomyopathy, atherosclerosis, diabetes or a CC disorder related to cell signal processing and metabolic pathway CC modulation. The NOVX polypeptide, nucleic acid and antibody are useful for treating or preventing a syndrome, e.g. various tissue/organ CC inflammation, muscular dystrophy, neurological and neurodegenerative CC diseases, cardiovascular diseases, coagulation disorders, cancers CC (leukaemia, adenocarcinoma), multiple sclerosis, respiratory diseases, CC (reproductive disorders, allergy, seizures, mental depression, epilepsy, CC gastro-intestinal diseases, bone disorders, nephrological disorders, CC urinary system disorders, immunological disorders, Addison's disease, CC urinary system disorders, immunological disorders, Addison's disease, CC migraine, dermatomyositis and bronchitis. The present sequence is a PCR compensation is incorrectly referred as SEQ ID NO: 75 in page 168 of the

The method is useful for judging relative onset risk cof diabetes accompanying. This sequence represents a PCR primer used ct o amplify intron 3 of the GFAT1 gene in order to determine polymorphisms of the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

The invention comprises DNA sequences which are associated with intestinal epithelium and peyer's patch M cells. The DNA sequences of th invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious disease, autoimmune diseases (e.g. haemolytic annemia, rheumatoid arthritis, dermatitis, Grave's disease, multiple sclerosis, allergy, asthma and diabetic mellitus), diseases or disorders of the immune system, hypersensitivity, anaphylaxis, and blood group incompatibility. The present DNA sequence represents a PCR primer that was used to amplify an intestinal epithelium/peyer's patch M cell-associated DNA sequence of the invention

Typing genes that contain polymorphic microsatellite loci, useful identifying predisposition to disease, by amplification and determ length of amplicons. determining

Example 3; Page 34; 64pp; German

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or and prediagnosis (M3) of diseases associated with gene ML. The method is used to identify microsatellite marker elated gene, that are associated with a predisposition t that

Novel isolated or purified polypeptide encoded by genes associated with intestinal epithelium or M cell development, differentiation or function useful for treating autoimmune diseases and infectious diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the human prion protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                 Sequence 41 BP; 6 A; 16 C; 9 G; 10 T; 0 U; 0 Other;
                                                                                                                                                       The invention relates to a human protein designated 10.01, containing the Phe-His aminolyase active site. Also disclosed are the encoding polynucleotide, and a method for preparing the polypeptide by DNA recombination. The application of the polypeptide is in treating arrhythmia and diabetes. Also disclosed are the antagonist against this polypeptide and its therapeutic action, and the application of the polynucleotide. The current sequence represents a human protein 10.01
                                                                                                                                                                                                                                                                                                         New human protein 10.01 containing Phe-His aminolyase active site and encoding polynucleotide, useful for treating arrhythmia and diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                           for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82001-082706 and AAQ91325-Q91358 for STS primers. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence sampled mapping; genomic analysis; complex genome mapping;

The MMS are polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 10 primer pairs are shown in AAQ95819-40. The published size range of the D13S164 allele is 208-219 bp, and the degree of heterozygosity in the population is
The sequences given in AAT10742-67 are synthetic oligonucleotides which are used in the construction of the electronically self- addressable device (ED) of the invention. The ED comprises a substrate, an electrode or opt. a number of electrodes supported by the substrate, a current source operatively connected to the electrode and an attachment layer adjacent to the electrode which is permeable to a counterion but not permeable to a molecule capable of insulating or binding to the electrode. The attachment layer is capable of attaching a macromolecule.
                                                                                                                                                                                                                                                                                  Electronically self-addressable device e.g. nucleic acid hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The primers AAT65798-T66047 were used to PCR amplify the inserts from the isolated clones containing the repeat sequences. The primers AAT66018-9 were used to amplify the repeat sequence marker clone Mfd111 (AAT65782). (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               binding entity, such as one of these probes, attached to each of locations capable of detecting the presence of a genetic sequence
                                                                                                                                                                                                                                                Claim 7; Col

                                                                                                                                                                                                                                                 The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85872 represent exon primers used for obtaining LRP5 CDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, vital infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Todd JA, Hear

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               insulin dependent diabetes mellitus; autoimmune disease; glomerulonephritis; inflammation; viral infection; osteoporosis; hypercholesterolemia; Alzheimer's disease; low density lipoprotein;
                                                                                                                                                                                      The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85823 to AAV85900 represent SNP primers used for obtaining LRP5 cDNA. Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, tral infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAV85825;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAV85825 standard; DNA; 19
                                                                                                                                                                                                                                                                                                                                                                    New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 15-APR-1997;

Products from the present invention
                                                                                                                                                                                                                                                                                                                                                                   The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85587 to AAV85822 represent exon primers used for obtaining LRP5 cDNA. Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (LDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated LDL-receptor related protein - used to develop products treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Todd JA, Hess JW, Caskey

                                                                                                                                                                                                                                                                                                                                        The invention relates to aminooxy-modified(oligo)nucleotides or nucleosides which are useful as therapeutics, diagnostics, and research reagents. They may be used, e.g., for modulation of the ras gene and may be able to modulate the process of transformation from normal to malignant cell growth. They may be prepared using known methods. Inclusion of the aminooxy moieties can improve binding of oligonucleotides to complementary strands. The moieties can also provide conjugation sites useful for conjugation of useful ligands (e.g. reporter groups and groups for modifying uptake, distribution or other pharmacodynamic properties) to oligonucleotides. The present sequence represents an example of an aminooxy-modified oligonucleotide disclosed in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-FEB-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates, inter alia, to a method of preparing an oligonucleotide by coupling (1) a new nucleoside having a protected 5'-hydroxy group and at the 3'-position a group of formula -CH2-P(OR3)-NRAR5, with (2) a nucleoside or oligonucleotide having a free 5'-hydroxy group, to give (3) a precursor having an internucleoside linkage of formula -CH2-P(OR3)-O-; and converting this to a linkage of formula -CH2-P(OR3)(-X)-O- (where X = S or O). The present sequence is a specific example of an oligonucleotide so prepared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New tetra:hydro:furan oligo:nucleotide(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modified_base

The specification describes a self-addressable, self-assembling control multi-step and multiplex molecular biological reactions in control multi-step and multiplex molecular biological reactions in comic microscopic formats. A key aspect of this inventions is played by the ion comparemeable permeation layer which overlies the electrode. This permeation comparement of nucleic acids to permit immobilization but call of the sequences from the highly reactive electrochemical environment generated commendately at the electrode surface. The microelectronic device is consigned and fabricated to actively carry out and control reactions such comparation, diagnostics and biopolymer synthesis. The device can comparation, diagnostics and biopolymer synthesis. The device can comparations. The device can subsequently control the transport and attachment of specific micro-comparations. The device can subsequently control the transport and reactions. The device is able to concentrate analytes and reactants, remove non-comparate concentrate annotation of analytes. The device is and improve the detection of analytes. The concentrate annotation and improve control for DNA concentrates and approve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes. The concentrate annotation and improve the detection of analytes.

The primers are used to amplify gene sequences to generate information necessary to compile haplotype profiles. The haplotype profiles can be used to detect presymptomatic and symptomatic glaucoma. They can also be used to localise, isolate and identify the GLC1B and GLC6p25 loci so that detection of individuals with glaucoma is enhanced. The haplotype analyses also provide means for identification and following of mutant alleles in pedigrees or populations. Identification of presymptomatic individuals using the methods allows intervention in the disease process and obviates the impact of inheriting a mutant allele causing disease, by medically disrupting the initiation or progression of the disease, by medically disrupting the initiation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pharmaceutical discovery, enzyme assays, immunoassays and other biological assays. The method provides a rapid and convenient approach for detection and identification of microorganisms. It can be adapted to sequence-dependent or sequence-independent tests. The invention provides improved accuracy, faster detection, and overall lower cost in detection and identification of microorganisms. The presence of nuclease is measured more accurately and sensitively by red-shifting the emission wavelength from far IV region (350-400 nm) to the 500-600 nm region of the electromagnetic spectrum and reducing the effect of background signal levels of intact reagents. The present sequence is used in the course of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        substrate bearing quenched fluorescent moieties. The enzyme-specific cleavable polynucleotide substrate is useful in biological assays for detection and identification of microorganisms, sterilization assurance,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   An enzyme-specific cleavable polynucleotide substrate bearing quenched fluorescent moieties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     at a PGI-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the

The modified oligomeric compounds have increased binding affinity and increased nuclease resistance. The oligomeric compounds can be used in diagnostic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oligonucleotide. The specification describes containing 2'-O-modified ribosyl nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an uniform phosphodiester oligonucleotide. The specification describes oligomeric compounds containing 2'-0-modified ribosyl nucleosides. The 2'-0-modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel 2'-O-aminoethyloxyethyl modified nucleosides and oligonucleotides used in diagnostic, therapeutic and research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

The methods are us the polymerase chain reaction (FCR), molecular cloning and disease diagnosis and treatment. The present sequence was used in a demons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   structures that position the sugar moiety of the nucleosides preferentially in 3' endo geometries. The modified oligomeric compounds have increased binding affinity and increased nuclease resistance. The oligomeric compounds can be used in diagnostic, therapeutic and research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          molecular

The invention relates to oligonucleotides comprising nucleotides covalently linked together by internucleotide linkages where at least 1 nucleotide is linked to adjacent nucleotide by a 2',5'-internucleotide is allowed to adjacent nucleotide by a 2',5'-internucleotide in gene therapy and are also useful in antisense methodologies, diagnostics, therapeutics and as research reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ95241;
                                                                                                                                                                                                                                                                               Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel modified oligonucleotides, useful in antisense methodologies, diagnostics, therapeutics and as research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 misc_RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified oligonucleotide
                                                                                                                                                                                                                                                                                                                                     This sequence represents a modified oligonucleotide used in the course of the invention. The invention relates to oligonucleotides comprising nucleotides covalently linked together by internucleotide linkages where at least 1 nucleotide is linked to adjacent nucleotide by a 2',5'.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-JUL-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in a complementary nucleic acid strand. It also relates to coligonucleotides wherein at least some of the nucleotides are functionalised to be nuclease resistant, at least some of the nucleotides conclude a substituent that potentiates hybridisation of the coligonucleotide to a complementary strand, and at least some of the coligonucleotide to a complementary strand, and at least some of the conclude a 2'-deoxy-erythro-pentofuranosyl sugar molety. The conclude include a 2'-deoxy-erythro-pentofuranosyl sugar molety. The conclusion of one or more aminooxy moleties in such oligonucleotides corporated binding of such oligonucleotides to a complementary strand. The oligonucleotides of the invention aare used as diagnostic, concludes for research respectity, and can be used to modulate gene captession in organisms. The oligonucleotides containing the modified concleosides have increased nuclease resistance and increased binding affinity to a complementary strand. The present sequence represents an coligonucleotide containing nucleotides substituted with a 2'-O-{2- [N-(2- amino) ethyl-N-(methyl)] aminooxyethyl} group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                 Oligonucleotide ISIS 22115 contains a mixed phosphodiester and phosphorothioate backbone and has 2'-O-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A-and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Key

```
geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide;
dermatological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2'-Modified chimeric oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-MAR-2001
                                                                                              This sequence represents 2'-modified chimeric oligonucleotides containing 2'-modified T. The nucleotides were used to examine the effects of the modifications on nuclease resistance. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form
                                                                                                                                                                                   New oligonucleotides containing sequences with A and B geometry, used treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA.
                                                                                                                                                                                                                                                             Manoharan M,
                                                                                                                                                                                                                                                                                                                                                                 09-NOV-2000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               modified_base

Oligonucleotide ISIS 22112 contains a phosphorothioate backbone and has 3'-O-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for NNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     dermatological;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease metry strance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory this confirmation of the confirmation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 19

Novel oligonucleotides of the invention have both A-and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide ISIS 22114 contains a mixed phosphodiester and phosphorothioate backbone and has 3'-O-(2-methoxyethyl) chemis

It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligonucleotides containing sequences with A and B geometry, u treat and diagnose e.g. psoriasis, skin cancers and viral, fungal bacterial infections, bind to single stranded RNA or DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligonucleotide ISIS 22111 contains a phosphodiester backbone and has 2'-
0-(2-methoxyethyl) chemistry. It was used in experiments to determine the
effects of snake venom phosphodiesterase and liver homogenate on the
stability of oligonucleotides. Novel oligonucleotides of the invention
have both A- and B-form conformational geometry. The A-form geometry
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotides containing sequences with A and B geometry, used treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Manoharan M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel synthetic method (M) comprising: (a) providing a sample comprising a number of oligomers of formula (I); (b) contacting the sample with a deprotecting agent to remove R t groups from the oligomers; and (c) reacting the oligomer with a cleaving reagent. The method is used to produce oligomeric compounds for use in antisense and oligonucleotide therapies. The method enables the synthesis of oligomers with a reduction in the number acrylonitrile groups attached.

Acrylonitrile has been demonstrated to be a potent carcinogen in rats. This sequence represents a phosphorothioate 20-mer primer which is used the product of the carcinogen of the carcinogen in rate.
          The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as
                                                                                                                               Detaching nucleic acid molecule comprising unconventional nucleotide incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                07-FEB-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAC62454 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 19
                                                                                                                                                                                                                                                                                                            05-OCT-2000
                                                                                                                                                                                                                                                                                                                                                                                misc_RNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention
                                                                                                                                                                                  Guanidinium functionalized oligomers prepared from units, are hybridizable with a specific RNA or DNA diagnostic and therapeutic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAF31458 standard; DNA; 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 1 U; 0 Other;
                                                                                      Sequence 19 BP; 0 A; 0 C; 0 G; 19 T; 0 U; 0 Other;
                                                                                                          diagnostic and investigative purposes
                                                                                                                  The present invention relates to nucleotide oligomers comprising monomer units. Oligomers modulate gene expression when hybridized by a single-organized nucleic acid. They are useful for gene therapy,
                                                                                                                                                                                                                                                                                                  07-JUL-1999;
                                                                                                                                                                                                                                                                                                                       07-JUL-2000; 2000WO-US018609
                                                                                                                                                                                                                                                                                                                                                                   WO200102423-A2

The present invention specifically claims AAH56368 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding groE. More generally, antisense compounds (1) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a microorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises with and inhibits the expression of GL or GS, is claimed. (1) have antibacterial, antiviral and antiproliferative activities, and can be used in antisense therapy and for inhibiting expression of GL or GS in cells or tissues in vitro. (1) are also useful for inhibiting the growth of a microorganism, or inhibiting the expression of GL or GS in cells or tissues in vitro. (1) are also useful for inhibiting the growth of a microorganism, or inhibiting the expression of GL or GS gene in a microorganism (a bacterial cell or a microorganism (bacterial cell or a microorganism (call or a microorganism call or a microorganism call or a microorganism call or a microorganism (call or a microorganism call or a microorganism call or a microorganism call or a microorganism (call or a microorganism call or a micro
                                                          virus) having a GL or GS gene which involves administering to the microorganism or to a cell infected with the microorganism, (I). (I) are also useful for treating a mammalian pathological condition mediated by the microorganisms which involves identifying a eukaryotic organism having a pathological condition mediated by microorganisms having a GL of GS gene and administering (I) such that the growth of microorganism is inhibited. The antisense compounds are utilised for diagnostics, therapeutics, prophylaxis and as research reagents and kits, e.g., to prevent or delay microbial infections in humans. They are also useful as molecular weight markers. AAH5632 to AAH56367 and AAH56831 to AAH56854 represent PCR primers for groß sequences which are used in the exemplification of the present invention. AAH56855 to AAH56870 represent groß nucleotide sequence given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antisense compounds targeting nucleic acid encoding groEL or gene of microorganism, which hybridize with and inhibit expression genes, useful to inhibit growth of microorganism having the genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ψРІ; 2001-355633/37.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC sligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC discontity of a SNP and for genotyping nucleic acid sample by CC assess by association analysis the genotype of an individual or group of CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC aused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic CC traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune confidence, rhervans system diseases and infection by nathogenic influence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches 17;

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence or CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC aussed by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC osteogenesis imperfecta and acute intermittent polycystic kidney disease, CC osteogenesis imperfecta and acute intermittent polycystic benotypic traits also include symptoms of or may be genetic such as autoimmune CC disease of which a component is or may be genetic such as autoimmune CC inflammation. Cancer, nervous system diseases and inferrion by narhoranic conference pervous system diseases and inferrio
inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Page 63; 83pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         acid sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New genotyping oligonucleotide, useful for detecting the presence,

SNP specific upper 14-AUG-2001

PCR primer SEQ ID 3113.

(first entry)

single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis stic kidney disease; osteogenesis imperfecta; autoimmune disease; intermittent porphyria; rheumatoid arthritis; multiple sclerosis; investigation;

26-APR-2001.

13-OCT-2000; 2000WO-US028436.

```
CC includes kits for determining the presence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC system of the control of the primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of coligonucleotides, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. coligonum algoritis and acute intermittent porphyria. Phenotypic constends and acute intermittent porphyria. Phenotypic constends also include symptoms of or susceptibility to multifactorial coliseases of which a component is or may be genetic such as autoimmune confidence, nearous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases and infection by pathogenic confidence, nervous system diseases and infection and pathonism and confidence in the present sequence represents a PCR primer specific for a human SNP containing NNA segmence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S

The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in an acetonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain enzymes which recognise nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparing sulfurized 2' substituted phosphorothioate oligonuclectides useful in biological research, comprises phosphitylating the 5'-hydroj of a nucleic acid having a nucleoside with a 2' modification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of DNA-RNA oligonuclectides which can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNase H substrate used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Crooke

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNASE H substrate used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of DNA-RNA oligonucleotides which can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of
                                                        patient sample. identification of the development o
                                                                                 PCR primers AAC62163-64 were used to amplify a human apolipoprotein CI (APOCI) allele. The primers are used in the method of the invention. The specification describes a method for screening for a genetic factor for having an enhanced risk of developing Alzheimer's disease. The method comprises amplifying the genomic DNA encoding an APOCI region in a patient sample. The method is useful for early screening or identification of Alzheimer's disease, and for monitoring the presence of identification of Alzheimer's disease, and for monitoring the presence of
                                                                                                                                                                                                                                                                                                                                                                                   Screening for a genetic factor for having an enhanced risk of developing Alzheimer's disease (AD), useful for identifying and monitoring the presence or development of AD, by amplifying the DNA encoding an apolipoprotein CI region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAC62164 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 1 U;

The primers are used in the method of the invention. The specification describes a method for screening for a genetic factor for having an enhanced risk of developing Alzheimer's disease. The method comprises amplifying the genomic DNA encoding an APOCI region in a patient sample. The method is useful for early screening or

```

The present sequence is a modified oligonucleotide. 2'-O-acetamic modified nucleosides were used to produce oligonucleotides which enhanced nuclease resistance and superior hybridisation properties.

leotides which have ation properties that identification or

2'-0-acetamido-

The present invention relates to a method for the qualitative and quantitative detection of targets in a sample by molecular interact between the target and probes in an array. The method can be used detect interactions between nucleic acids, antigens and antibodien

receptor and ligands,

particularly

c acids, antigens in applications s

They have a modified nucleoside monomer and are specifically hybridisable with a preselected nucleotide sequence of a single-stranded or double-stranded target deoxyribonucleic acid or ribonucleic acid molecule. The oligomers are further useful in a ras-luciferase fusion system using ras-luciferase transactivation. They are useful in abnormal cell proliferation and tumour formation and modulation of expression of protein kinase C and cell adhesion molecules such as ICAM. They are useful in the modulation of proteins related to multidrug resistance and viral genomic nucleic acids such as HOV, herpes viruses, Epstein-Barr virus, cytomegalovirus, papillomavirus, hepatitis C virus and influenza
                                                                                                                                                                   Bickel

The presequence is a modifying oligonucleotide used in the exemplification
                                                                             The present invention relates to methods for distinguishing between individuals homozygous for and therefore afflicted with Van Buchem's disease, individuals heterozygous for and therefore carriers of Van Buchem's disease and individuals who are not afflicted with Van Buchem's disease comprise identifying a large genomic deletion in chromosome 17 at 17q21. The method is useful for identifying individuals who are afflicted with or carriers of diseases associated with one or more genomic deletion, particularly Van Buchem's disease, which is a rare autosomal recessive disorder that results in a bone dysplasia referred to a craniotubular hypertosis. The present sequence is a PCR primer used to amplify 92Kb gene fragment in human chromosome 17 at 17q21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 19 BP; 0
                                                                                                                                                                                                                                                                          Methods for identifying subjects who are afflicted with or carriers of diseases associated with genomic deletion(s), e.g. Van Buchem's disease, by determining the presence of a deletion in the 92 kb region of human chromosome 17 at 17q21.
                                                                                                                                                                                                                                                                                                                                                                                                                                          28-JUL-2000;

CC The present sequence is that of a chimeric oligonucleotide having some 2' cc -methyl thioethyl modifications. This was compared with oligonucleotides CC with methoxyethoxy (see ABA91950) and dimethylaminopropyl (see ABA91951) cc modifications for resistance to snake venom phosphodiseterase. The assay revealed the nuclease resistance of the modified oligomers. The invention CC provides methods for the alkylation of alcohols, amines, thiols and their CC derivatives by cyclic sulfate intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-hydroxy position of nucleosides and CC their analogues with cyclic sulfates to form the 2', 3' or 5'-O-alkyl CC sulfate modified compounds are disclosed. Displacement of the 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-modified CC nucleosides and their analogues. The methods are especially useful for CC the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates that are precursors for the preparation of oligomeric cc compounds useful as therapeutics, diagnostics and research reagents
